

Fun with Functional JavaScript

seriously, no more slapping...

- Functional Programming*
- Functions as first class citizens
 - can be passed as arguments (higher order functions)
 - can be returned from other functions
 - can be stored in variables and data structures
 - Pure functions
 - always the same result for the same params - caching
 - independent from other function calls - parallelism
 - Immutability
 - Recursion
 - tail call optimisation

EcmaScript 6 aka ES.next aka Harmony

- arrow functions
- tail call recursion optimisation
- destructuring arrays and objects
- spread operator
- rest parameters

let's see some code...

Conclusion

- Functional programming is a lot of fun:
– An easy way to learn the language
– Readable and elegant
– New features
 - closures
 - lambdas (anonymous functions)
 - pure functions
 - immutability
 - tail call optimisation

Functional JavaScript?!

- first class functions :)
- closures :)
- lambdas (anonymous functions) :)
- pure functions :)
- immutability :)
- tail call optimisation :)

let's see some code...

functional.js

- a functional programming library for JavaScript
- created by Lee Croissley
- in constant development and use
- gaining traction
 - 100+ daily npm downloads
 - over 30 github stars
- currying implemented by default
- parameter order optimised for partial application

let's see some code...

lodash

- very useful "utility belt" library
- port of underscore.js (comes from `_`)
- provides loads of functions to manipulate
 - arrays
 - collections
 - functions
 - objects
- supports curry/partial application

let's see some code...

Conclusions

- Functional programming in JS is lots of fun!
- A new way to look at the language
- Rapidly developing
 - new frameworks
 - new libraries
 - new language features
- Dear functional programmer, give JS a chance
 - not as good as your FP language
 - but maybe good enough?
